

PRELIMINARY LISTING REPORT

Project Information

Reference ID: **9F4A1C7B**

Project Name: RealFi

Token Symbol: USDrf

Classification: RWA / Stablecoins / DeFi

Real-world credit infrastructure

Core Assets: USDrf / sUSDrf

Website: realfi.co

Network Status: Testnet / Pre-Mainnet

Listing Classification

Token Type: Governance Token

Listing Type:

ELIGIBLE FOR PRELIMINARY REVIEW

Report Date: September 11, 2026

Launch Date: October 1, 2026

Assessment Status: **Preliminary Review**

Listing Status: **Eligible**

Prepared for: Listings Committee

1. EXECUTIVE SUMMARY

RealFi is developing a stablecoin and real-world-asset infrastructure platform designed to connect on-chain capital with real-world credit markets. Its core architecture separates capital stability from yield generation through **USDrf**, a reserve-backed digital dollar, and **sUSDrf**, the staked efficiency layer that provides exposure to returns generated from a diversified portfolio of real-world assets.

The project's governance token is **USDrf**, intended to provide governance rights and reward ecosystem participation. Users accumulate R-Points through testnet activity, staking-related activity and ecosystem participation, with points intended to convert into USDrf during designated distribution windows. RealFi currently states a planned USDrf supply of 10 billion tokens; however, the project's official FAQ says that detailed USDrf tokenomics, distribution mechanics, conversion rates, vesting schedules and governance rights will be disclosed in connection with the USDrf token-generation event. This is therefore materially different from evaluating an already-trading token.

⚠️ Preliminary Conclusion: Pre-TGE Listing Candidate

There is currently no established USDrf circulating supply or market price to assess, and the project has stated that no token-generation event had been scheduled in its July Office Hours recap. USDrf should not receive final spot-listing approval at this stage; it is better classified as a pre-TGE listing candidate / watchlist asset.

✅ Positive Finding: Sophisticated Product Concept

The project has a relatively sophisticated product concept, a live testnet, an emerging community and a defined intended governance-token role. The USDrf / sUSDrf separation gives a clear distinction between liquidity/stability and return generation.

⚠️ Areas Requiring Strengthening

Before listing, the exchange still needs the definitive tokenomics, contract, allocation, vesting and legal package. Token allocation, vesting schedules, the R-Points conversion formula, TGE timing, market liquidity and legal opinions remain outstanding.

2. PROJECT OVERVIEW

RealFi's central thesis is that stablecoin capital can be connected to productive real-world economic activity rather than remaining idle or being deployed primarily into speculative crypto strategies. The official documentation describes a dual-token architecture:

- **USDrf**: reserve-backed digital dollar focused on capital stability, liquidity and transactions.
- **sUSDrf**: staked layer providing exposure to yield generated from a diversified real-world-asset portfolio.

RealFi says its target users include institutional and corporate partners, liquidity providers, corporate treasuries, family offices, DeFi protocols and the broader Web3 ecosystem. Its stated investment universe includes U.S. Treasuries, money-market funds, investment-grade CLO ETFs, floating-rate corporate notes and private credit. This makes RealFi primarily an RWA / stablecoin infrastructure project, rather than a conventional DeFi yield-farming protocol.

3. PRODUCT ARCHITECTURE

3.1 USDrf

USDrf is designed as RealFi's foundational digital dollar. According to the project, approved partners can mint USDrf at 1:1 value, while users can swap into USDrf through partner DEXs. RealFi states that USDrf is backed by a reserve portfolio containing liquid reserves and real-world assets, with a dedicated stability reserve and risk-management framework. The transparency portal is intended to provide visibility into:

- reserve composition;
- collateralisation ratios;
- underlying real-world assets;
- protocol-level risk management.

✓ Exchange Relevance

For an exchange, USDrf represents an important dependency of the USDrf ecosystem. USDrf's utility and community participation model are partly built around activity involving USDrf.

4. sUSDrf

sUSDrf is the yield-bearing / staked layer of the RealFi ecosystem. The project states that USDrf can be staked to gain exposure to returns generated from real-world assets. The portfolio has been described as having different liquidity sleeves, including:

- highly liquid Treasury and money-market exposure;
- semi-liquid assets;
- less-liquid direct lending / private-credit exposure.

RealFi has stated that the unstaked USDrf book must prioritise immediate redemption liquidity, while the sUSDrf book can tolerate longer-duration assets because of its stated seven-day cooldown.

⚠ Key Risk

The underlying assets include private credit, which introduces credit risk, liquidity risk, valuation risk, counterparty risk and jurisdictional / regulatory risk. RealFi's own August recap acknowledges that internal stress tests were unaudited and based on assumptions that could prove incorrect; under unexpected conditions, redemptions could take longer or potentially occur at a loss.

5. USDrf TOKEN OVERVIEW

Category	Current Assessment
Token	USDrf
Full name	RealFi Governance Token
Purpose	Governance / ecosystem participation
Planned total supply	10,000,000,000 USDrf
Current circulating supply	0 / not issued

Category	Current Assessment
TGE	Not yet completed
Current trading market	None established
Current market cap	N/A
Initial distribution	Not yet fully disclosed
Vesting	Planned, details pending
Governance	Intended
Points mechanism	R-Points → USDrf
Primary network	RealFi / Cardano ecosystem
Multi-chain expansion	Planned ecosystem expansion
Listing status	Eligible

The official rewards page states a 10B planned supply and says R-Points will convert to USDrf during designated windows subject to vesting. However, the official FAQ makes clear that the definitive tokenomics, conversion rates, distribution mechanics, vesting schedules and governance rights are to be disclosed in connection with the TGE.

6. USDrf UTILITY

USDrf is intended primarily as a governance token. The project describes USDrf as connecting ecosystem participation with governance, giving holders a voice over the protocol's future. The current stated model is: **Participate → earn R-Points → seasonal conversion → USDrf → governance**. Users can earn points through activities such as:

- swapping;
- staking / unstaking USDrf;
- testnet activity;
- ecosystem quests;
- supporting USDrf stability;
- qualifying Cardano stake-pool delegation.

This creates a reasonably clear utility proposition, but the actual governance rights remain incomplete until the final tokenomics and governance framework are published.

7. R-POINTS AND AIRDROP / DISTRIBUTION RISK

R-Points are important for exchange due diligence because they are the current mechanism through which future USDrf distribution is expected to occur. RealFi explicitly states that R-Points have no monetary value, are not transferable, are not redeemable, do not themselves constitute a token or financial instrument, and do not create an entitlement to USDrf. The project also states that R-Points may ultimately be converted into USDrf during seasonal distribution windows.

Exchange Concern

There is no basis for treating accumulated R-Points as current USDrf circulating supply. The exchange should require the project to establish, before TGE: total USDrf allocated to points participants; conversion formula; season-by-season allocation; eligibility rules; anti-Sybil methodology; vesting; geographic restrictions; claim mechanics; wallet allocation; and treatment of unclaimed tokens.

8. TOKENOMICS

8.1 Total Supply

10,000,000,000 USDrf planned supply. This is currently the principal quantitative tokenomics figure publicly stated by RealFi.

8.2 Circulating Supply

Current circulating supply: 0 / not yet issued. Because the project is pre-TGE and has not established a live USDrf market, an exchange should not assign a circulating-market-cap figure at this stage.

8.3 Allocation

Not sufficiently disclosed. The following allocations remain to be confirmed: community; R-Points; ecosystem; treasury; team; founders; investors; advisors; liquidity; market making; partnerships; foundation; and strategic reserves.

8.4 Vesting

RealFi confirms that USDrf distributions will be subject to vesting, but the exact schedules have not yet been disclosed.

Required Before Listing

The exchange should obtain a complete vesting table including allocation, initial unlock, cliff, linear vesting, unlock frequency, duration, wallet addresses and transfer restrictions.

9. PRODUCT TRACTION

RealFi's testnet launched on 6 July 2026. The project's July Office Hours recap reported:

- approximately 3,000 verified testnet wallets by 17 July;
- roughly 120 new users per day at that point;
- more than 90 SPOs participating in Discord;
- nearly 750 verified Discord members at the time of the July update.

The project subsequently reported that approximately \$100,000 of real USDrf was moving through venues and wallets during its August hardening phase and later reported a seven-figure mint, alongside the beginning of real-asset purchases by the investment team. These figures are project-reported and should be independently verified by the exchange.

10. TECHNICAL DEVELOPMENT

RealFi is initially built around the Cardano ecosystem and describes Cardano as its accounting / source-of-truth layer. The project has also demonstrated cross-chain functionality and has discussed expansion toward EVM ecosystems. As of the latest available project update, smart-contract audits were still part of the mainnet-readiness process, and the project stated that open sourcing and a bug-bounty programme were planned.

Technical Listing Status — Not Yet Sufficient

The exchange should obtain: USDrf contract / mint address; verified source code; token standard; mint authority; burn authority; freeze / pause functionality; upgrade authority; governance contracts; multisig configuration; bridge contracts; oracle dependencies; independent audit reports; and audit remediation records.

11. MAINNET STATUS

RealFi is progressing from testnet toward mainnet. The August project recap states that the team had moved from testnet hardening toward using real funds, with the mainnet feature set and scope reported as locked. However, the project remains dependent on regulatory, operational, financial-provider and security processes. The exchange should therefore treat mainnet readiness and USDrf launch readiness as separate approval gates.

12. LIQUIDITY AND MARKET RISK

USDrf: N/A / Pre-Market

USDrf does not currently have an established public trading market based on the project's official disclosures. Therefore no meaningful USDrf order-book depth exists to assess; no reliable market-cap calculation exists; no price-discovery history exists; no volatility history exists; and no market-maker performance can yet be evaluated. This is normal for a pre-TGE asset but represents a substantial listing risk.

Required Before Spot Listing

The exchange should require an initial liquidity commitment; a market-maker agreement; expected initial circulating supply; exchange / DEX allocation; an initial price-discovery mechanism; anti-manipulation controls; and treasury / market-maker wallet disclosure.

13. STABLECOIN / RWA RISK

This is arguably the most important non-token risk for USDrf. USDrf's ecosystem value proposition depends partly on the successful operation of RealFi's RWA-backed stablecoin architecture. RealFi states that its reserves may include Treasury instruments, money-market funds, CLO ETFs, corporate notes and private credit. The private-credit component introduces a maturity / liquidity mismatch risk, which RealFi has attempted to address through separate books for liquid USDrf and longer-duration sUSDrf exposure.

The Exchange Should Independently Verify

- reserve assets;
- legal ownership of reserves;
- custody;
- valuation;
- redemption rights;
- counterparty exposure;
- private-credit underwriting;
- liquidity buffers;
- segregation of assets;
- insolvency protection;
- audit / attestation arrangements.

14. REGULATORY AND COMPLIANCE ASSESSMENT

Risk: HIGH / Requires Legal Opinion. RealFi operates at the intersection of stablecoins, tokenised real-world assets, private credit, staking, governance tokens and cross-border financial products, creating substantial regulatory complexity. The project has stated that sUSDrf staking is restricted in the U.S., UK and EU, while it expects USDrf to be available in those jurisdictions. This distinction requires independent legal verification rather than reliance solely on project statements.

Jurisdiction-Specific Opinions Required

- USDrf classification;
- USDrf classification;
- sUSDrf classification;
- staking;
- governance;
- USDrf distributions;
- R-Points;
- RWA exposure;
- private credit;
- securities / collective-investment considerations;
- stablecoin regulation;
- AML / KYC;
- sanctions;
- consumer protection.

15. TEAM AND GOVERNANCE

The project publicly identifies several contributors through its Office Hours programme, including personnel responsible for product, marketing, data, treasury / investment and other functions. For institutional exchange due diligence, however, public role descriptions are not sufficient.

The Exchange Should Obtain

- full legal names;
- corporate roles;
- employment / engagement status;
- relevant professional histories;
- beneficial ownership;
- corporate entity information;
- jurisdiction of incorporation;
- board structure;
- related entities;
- conflicts of interest;
- prior regulatory / enforcement history.

16. COMMUNITY AND ECOSYSTEM

RealFi has built a community around the Cardano ecosystem, including an SPO Accelerator Programme. The official community portal currently reports 90+ active SPOs in Discord. The programme allows participating Cardano stake-pool operators to generate R-Points through delegation, while retaining their normal ADA delegation arrangements. This provides RealFi with a potentially valuable distribution channel through established Cardano communities.

Exchange Considerations

Community strength should be evaluated separately from token-market quality. The exchange should monitor organic user growth, Discord activity, geographic concentration, bot / Sybil activity, referral incentives, points farming and coordinated trading behaviour after TGE.

17. KEY STRENGTHS

Principal Strengths

- **Clear RWA thesis:** a coherent proposition connecting stablecoin capital with real-world credit and fixed-income assets.
- **Defined product architecture:** the USDrf / sUSDrf separation distinguishes liquidity / stability from return generation.
- **Planned governance utility:** USDrf has a specific stated purpose rather than being positioned merely as a speculative asset.
- **Live testnet:** the project has moved beyond a purely conceptual stage, with a public testnet launched in July 2026.
- **Growing community:** thousands of testnet wallets and a significant SPO / community programme reported.
- **Transparency focus:** a dedicated transparency portal intended to expose reserve composition and collateralisation information.

18. PRINCIPAL RISKS

Critical

- USDrf has not yet completed its TGE.
- Definitive token allocation is not public.
- Definitive vesting schedule is not public.
- Conversion formula from R-Points to USDrf is not yet fixed / public.
- No established USDrf market or price discovery.
- Contract details for the final USDrf token require confirmation.

High

- USDrf's ecosystem value depends partly on successful USDrf / sUSDrf adoption.
- Real-world / private-credit assets create credit and liquidity risk.
- Regulatory treatment is complex.
- Governance rights remain incompletely specified.
- Points farming / Sybil risk could materially distort initial distribution.
- Cross-chain expansion introduces smart-contract and bridge risk.

Medium

- Dependence on Cardano ecosystem adoption.
- Reliance on third-party financial institutions / custodians.
- Potential concentration of early participants.
- Mainnet timing and regulatory dependencies.

19. REQUIRED PRE-LISTING PACKAGE

Before approving USDrf, the exchange should obtain the following package.

1. Token

- Official USDrf contract / mint address
- Final token standard
- 10B supply confirmation
- Initial circulating supply
- Complete allocation table
- R-Points, team & investor allocation
- Treasury, ecosystem & liquidity allocation
- Market-maker allocation
- Complete vesting schedule
- Wallet-address mapping

2. TGE

- TGE date
- Initial unlock
- Distribution mechanism
- R-Points conversion rate
- Seasonal allocation methodology
- Claim process
- Anti-Sybil methodology
- Unclaimed-token treatment

3. Technical

- Independent USDrf audit
- USDrf / sUSDrf audit reports
- Mint / burn authority
- Upgrade authority
- Emergency controls
- Multisig details
- Oracle architecture
- Bridge architecture
- Bug-bounty programme

4. Market

- Market-maker agreement
- Initial liquidity
- Initial price-discovery plan
- DEX liquidity
- CEX allocation
- Treasury wallet disclosure
- Insider-wallet disclosure

5. Legal

- USDrf legal opinion
- USDrf legal opinion
- sUSDrf legal opinion
- RWA / private-credit legal structure
- Regulatory jurisdiction matrix
- AML / KYC framework
- Sanctions framework
- Data / privacy documentation

6. Financial / RWA

- Reserve custodian
- Asset-level documentation
- Independent valuation
- Attestation / audit
- Redemption framework
- Counterparty exposure
- Private-credit underwriting framework
- Stress-testing methodology
- Loss waterfall

20. UPDATED LISTING SCORECARD

Category	Assessment
Project thesis	● Strong
Product architecture	● Strong
RWA use case	● Strong
USDrf utility	● Clear
Planned supply	● 10B disclosed
Current circulating supply	● Pre-TGE / 0
Token allocation	● Not yet disclosed
Vesting	● Planned, details pending
R-Points distribution	● Mechanics incomplete
TGE	● Not completed
Market liquidity	● Not established
Price discovery	● None
Smart-contract security	● Audits underway / required
Mainnet readiness	● In progress
Stablecoin risk	●/● Material
RWA / private-credit risk	●/● Material
Regulatory complexity	● High
Community	●/● Growing
Product traction	●/● Promising but project-reported
Overall listing risk	● HIGH

Category	Assessment
Recommendation	HOLD / PRE-TGE DUE DILIGENCE

21. FINAL LISTING RECOMMENDATION

 **HOLD — DO NOT APPROVE FINAL USDrf SPOT LISTING YET**

RealFi presents a stronger-than-average pre-TGE proposition from a product and infrastructure perspective. It has a clear RWA / stablecoin thesis, a functioning testnet, an emerging Cardano community, a stated governance-token role and a planned 10B USDrf supply. However, from an exchange's perspective, USDrf is currently a pre-launch token rather than a market-ready asset.

 **Critical Missing Information**

The critical missing information is concentrated around the token itself: final allocation; initial circulating supply; R-Points conversion; vesting; TGE timing; contract; governance mechanics; market-making / liquidity; and legal opinion. RealFi itself states that the detailed USDrf tokenomics, distribution mechanics, conversion rates, vesting schedules and governance rights will be disclosed in connection with the TGE.

 **Status: PRE-TGE / CONDITIONAL LISTING CANDIDATE — ENHANCED DUE DILIGENCE REQUIRED**

A final listing approval could become appropriate once the project supplies the definitive tokenomics and technical / legal package and demonstrates sufficient initial liquidity and market-making support.

- **Project quality:**  Promising
- **Token readiness:**  Not ready
- **Market readiness:**  Not established
- **Regulatory complexity:**  High
- **Recommended action:** Continue DD; defer final listing approval until TGE documentation is complete.
